

# Algae Clean

Treats algae, lichens & fungi

## Multi Surface Algae Treatment

Algae is a natural phenomenon that grows on all external surfaces. Using an algicide will help to kill the algae aiding the elimination of regrowth.

Algae Clean removes algae, mildew, fungus, and lichen stains from external surfaces such as brick, concrete, paving, tiles, tarmac, painted plaster, pebble-dash and render.

- ✓ **No scrubbing**
- ✓ **Results in 3 days**
- ✓ **Environmentally friendly**
- ✓ **Once a year treatment**
- ✓ **Does not affect grass**
- ✓ **Helps prevent re-infection**

Algae Clean is a water-based, anti-bacterial fungicidal wash process that requires no scrubbing. The area is covered leaving a residual ingredient that slowly weathers off over a 3 day period, leaving a clean and refreshed surface. Algae Clean aids prevention of immediate re-infection and should be applied regularly (every 6 - 12 months).

Algae Clean will not harm surrounding grass areas. Works as an inhibitor to aid prevention of algae, moulds and fungi from re-growth.

# Algae Clean

## Treats algae, lichens & fungi

In recent years algae has become more prevalent on buildings due to:

- Prolonged wet weather coupled with a mild climate
- Clean Air Act: reduced air pollution, resulting in increase of airborne algae spores
- Climate change
- Poor detailing on the building

The term 'algae' is frequently used to describe the occurrence of various organic growths which are commonly found on external surfaces. These organic growths include a range of algae, lichens and fungi. In the UK & Ireland climate, algae only requires high moisture levels or high humidity for growth to occur. The Met Office has reported an increase in average rainfall of 6% since records began and believe this is set to continue. We should therefore take measures to aid its prevention.

An annual Algae Clean treatment is recommended to help aid prevention of algae growth.

**USE BIOCIDES SAFELY ALWAYS READ THE LABEL AND PRODUCT INFORMATION BEFORE USE**
